

When printing a spreadsheet that contains error codes, e.g. #DIV/0!. #N/A, many people delete the cells that contain the errors prior to printing – they may then forget to **undo** the deletions when closing the spreadsheet.

You can choose to have Excel not print the error values.

Follow these steps:

- Select the Page Layout tab on the ribbon.
- Click the **small arrow** at the lower-right of the **Page Setup** group. Excel displays the Page Setup dialog box.

- Select the Sheet tab
- Use the **Cell Errors As** drop-down list to choose how you want the error values printed.
- Click OK to close the Page Setup dialog box.
- The error message will appear on the sheet but not on the printout
